

Dear Hiring Team,

I'm a full-process Software Engineer who enjoys joining projects at any stage and making thoughtful, high-level design decisions that set teams up for long-term success. I'm especially passionate about engineering the developer experience and building systems that are clean, testable, and easy to extend.

Across my roles, I've focused on design choices that improve how teams build and ship software. I've standardized frontend components to create consistent user flows, introduced strong typing into untyped backends to reduce runtime errors, and designed integration testing foundations to catch issues early. I prioritize clear service boundaries, simpler APIs, and maintainable codebases that scale with both product and team growth, and I work closely with teammates to make sure technical decisions support what the team is actually trying to accomplish.

I also leverage responsible AI tools to accelerate repetitive tasks while maintaining high standards for correctness and readability. For me, strong engineering is not just about shipping features, but about creating systems and workflows that make future development faster, safer, and more enjoyable.

I would welcome the opportunity to bring this mindset to your team and contribute to building software that scales both technically and organizationally.

Best regards,
Scott Happy
